

# Monet's DOWNDRAFT FILTER For Airbrushing

Open 5 holes in top turntable for airflow and 4 holes for bolts. Sandwich air conditioning filter and screen between fan and upper turntable. Make sure nothing interferes with fan blades.

*This is how your unit should basically look.*

This is how it works.

You airbrush over unit. Paint overspray is sucked down by fan, into the first filter (the paper towel), and the second filter (the air conditioner foam filter.)

Cleaner filtered air passes out from under the fan. This unit also helps to reduce the amount of dust falling into your fresh paint.

Replace paper towel after each airbrushing session.

Total cost of building unit using salvaged computer fan..... Less than \$13.00
